

December

“News from the Den!”

With Christmas and the holidays right around the corner, we thought this would be a fantastic time to offer a few precision reloading tools for the shooters in your family. I know over the years that I have given my wife, Linda, a couple suggestions for Christmas and my birthday as well. I mean who wants something that you will never use like a tie (who wears a tie anymore?), and it is a special time so make it special with upgrading your reloading room!

A suggestion is one or even both of our small caliber reloading manuals ***“The Sensational Seventeen’s”*** or ***“The Terrific Twenties”***. When working with these fantastic calibers, these two manuals will save you time, frustration, and money by presenting many years of our work and testing results. The story of each cartridge with all the best loads and correct reamer prints are included plus what we and other precision long-range shooters have done with these outstanding small calibers! Place your order today at 330.897.0614. They are only \$33.00 postpaid!

For a really nice stocking stuffer or small gift, check out the ***K&M Micro-Adjustable Case Neck Turner*** or ***Deluxe Priming tool***. I have been using both of these fantastic accuracy tools for many years and let me tell you, in my opinion, there are none better for the money. The little micro-adjustable case neck turners are so easy to adjust and will turn any case neck to absolute precision match tolerances. The Deluxe Priming tool

is well made of solid steel and is very compact. I love the superb “feel” when seating a primer correctly and this tool has that special “feel” which is so important.

K & M Micro-Adjustable Case Neck Turner

Deluxe Priming Tool

I tell customers almost every day that one of the most important accuracy tools we offer is the **Series II Annealing tool**. We have been selling this tool to precision shooters for over fifteen years now. We sell them to many small caliber, bench-rest, 1000 yard, and even lead bullet shooters - all trying to achieve longer case life and improved accuracy. Annealing is so important if done correctly. The problem is that most people do not anneal correctly - they simply overheat the brass. This tool encircles the case with a moderate flame that heats uniformly without overheating the brass. Remember a propane torch has two major problems. It runs too hot and only comes from one direction. The Series II Annealing tip, which slides onto the basic propane torch encircles the case with a uniform flame and heats the brass slowly and uniformly. At only \$45.00 plus shipping, what a perfect little gift for the precision reloader!

Series II Annealing Tool

Finally yet importantly, is our **Portable Table Top Reloading Stand** that we have been discussing. We have been selling these over 15 years to customers all over the world! I ask shooters all the time why would you tie yourself down to your reloading room when you can load anywhere there is a table or a tailgate? I load in our great room in the winter by the stove, on the deck, and at the range in the summer. Even if you have a large reloading room, why would you want to clutter your benches and tables with reloading presses? Once you're done reloading, you can store your press under the bench or in the closet! For only \$69.95 plus shipping, this is one gift you will love and appreciate year around!
